Pin Driving Chuck
for use with SPIROL Model PM Manual Pin Inserter, arbor presses, or drill presses

**MODEL SPD**
Low cost alternative for low insertion force.

This light duty, stainless steel pin driving chuck is designed for use with SPIROL’s Model PM Manual Pin Inserter. It may also be used in a drill press or arbor press with an adapter.

An internal compression spring acts on the outer flanges of the jaws to provide retention force and hold the pin securely prior to and during installation. This feature eliminates the difficulty with handling small diameter or short pins. The tool is also designed to provide the operator with good visibility for aligning the pin with the hole in the work piece facilitating trouble-free installation.

To use this tool, install the Model SPD into the press adapter. Insert the pin into the SPD jaws, and align the pin with the hole in the assembly. Pull down the press lever. Downward movement of the press starts insertion of the pin into the hole. When the jaws of the Model SPD contact the assembly surface, an internal punch continues downward to complete the insertion of the pin to the desired depth - below flush, flush or above flush. When used in conjunction with SPIROL’s Model PM Pin Inserter, a stop can be set for specific and repeatable installation depths.

**MATERIAL**
300 Series Stainless Steel

**MAXIMUM FORCE**
200 lbs. (0.89kN)

SPIROL Pin Driving Chucks can be used for installation of Coiled Pins, Slotted Pins, and Solid Pins.
These heavy duty pin driving chucks are designed for use with SPIROL’s Model PMH or Model PMX Manual Pin Inserter. They may also be used in a drill press or arbor press with an adapter. In applications where the component is too large for a bench top press, the chuck may be used in conjunction with a pneumatic tool (air hammer).

This method is ideal for low volume applications where insertion forces are greater than 200 lbs. (0.89 kN). To use the tool, the operator would manually place the pin into the end of the driver. The split bushing at the tip provides spring tension to hold the pin securely in place prior to and during installation. The exposed end of the pin is then placed into the hole, and the installation is completed by either advancing the press handle or actuating the air gun.

The tools are available with a flush setting for driving pins flush with the mating surface or with a non-flush setting for driving pins to protrude above or recess below the mating surface. The standard design is focused around installing SPIROL’s Coiled Pins; however, custom tools are available for installing Slotted Pins or Solid Pins. Punches, springs and other replacement parts are available from stock.

Model PM, PMH and PMX Manual Pin Inserters

For Manual Installation

SPIROL Model PM, PMH and PMX vertical, manually operated, pin installation machines are designed to be portable, easily adjustable, and are especially suited to prototype and low-volume production.

Chucks for different diameter pins can be quickly and easily interchanged. These machines use SPIROL’s standard pin-driving chucks – the SPD, CXA, CXD or CXE.

Each machine includes tooling to install the pin diameter specified at the time of order. Additional tooling is available for all standard diameter pins allowing you to easily change pin sizes.

SPIROL Application Engineers will review your application and recommend the best solution to optimize your assembly process.

Automatic machines are also available from SPIROL!

Please refer to www.SPIROL.com for the most current specifications and standard offering. Printed materials may be out of date.
